# 1. AN OVERVIEW OF THE IO SYSTEM

---

## 1.1 Introduction

**Modular IO system** from Brainchild is innovative which provides a simple low cost solution for distributed I/O requirements.

The IO system consists of stand-alone Digital and Analog - Input/Output modules which are connected together on a **RS485** two wire multi-drop network.

The modules communicate using the **MODBUS RTU** protocol. A 32bit ARM CPU is used in the modules to provide high speed data processing and fast communications turn around times. Multiple baud rates are selectable from 2400 to 115200 baud.

All IO modules plug directly onto an industry standard DIN rail. All modules have a minimum isolation of 1000VAC rms between the field and logic.

The modules have been equipped with status led's which are used to indicate the status of the inputs or outputs. This visual indication assists with fault finding and diagnostics.

## 1.2 Application Configurations

There are a number of different configurations in which the IO modules may be used in a system. Some are listed as follows:

### 1.2.1 I/O Expansion.

There are a number of devices such as **PLC's** (Programmable Logic Controllers) and **HMI** (Human machine interface) which have a MODBUS Communications facility available. Many PLC and HMI manufacturers provide Modbus Master and Modbus slave drivers to communicate directly with third party devices using Modbus protocol using different kind of hardware connection. PLC/HMI can be configured as a MODBUS Master. IO modules are attached to the RS485 network and configured as RTU slaves. The address setting is via dip switches on the IO module itself. The PLC/HMI system use IO modules as remote I/O reducing cabling costs and increasing the I/O capability of the control system.

## 1.2.2 Data Acquisition

Another use of the IO Modules is for Data Acquisition where a **PC** (Personal Computer) is connected to the Network. Many SCADA software packages support the MODBUS Master Protocol and can hence retrieve data from Input Modules or send data to Output Modules. The **serial port** of the PC is connected to an **RS232/RS485 Converter** which in turn is connected to the Network.

## 1.3 Module Selection Table

MODEL	MODULE TYPE
<b>I/O MODULES</b>	
IO-16DI	<b>16 DIGITAL INPUT MODULE INCLUDING COUNTERS</b>
IO-16DO	<b>16 DIGITAL OUTPUT MODULE</b>
IO-4RO	<b>4 RELAY OUTPUT MODULE</b>

IO-8AIIS	<b>8 ANALOG INPUT 0 - 20mA / 4 - 20mA / ±20mA FULLY ISOLATED</b>
IO-8AIVS	<b>8 ANALOG INPUT 0 - 1V / 0 - 10V / ±1V / ±10V FULLY ISOLATED</b>
IO-8TC	<b>8 THERMOCOUPLE INPUT MODULE INCL. 0 - 50mV &amp; ±100mV I/P</b>
IO-8TCS	<b>8 TC INPUT MODULE INCL. 0 - 50mV &amp; ±100mV I/P FULLY ISOLATED</b>
IO-6RTD	<b>6 RTD INPUT MODULE - PT100, Ni120, PT1000, Ni1000, Ni1000LG &amp; Ohms</b>
IO-DAIO	<b>2 RTD I/P, 2 ANALOG INPUT 0(4) - 20mA / 0(2) - 10V, 1 ANALOG OUTPUT 0(4) - 20mA / 0(2) - 10V, 4 DIGITAL INPUTS, 2 DIGITAL OUTPUTS</b>
IO-8AOI	<b>8 ANALOG OUTPUT MODULE 0(4) - 20mA</b>
IO-8AOV	<b>8 ANALOG OUTPUT MODULE 0(2) - 10V</b>

## 2. IO GENERAL INFORMATION

---

### 2.1 Physical Dimensions

The IO enclosure is shown below. The module clips directly onto an industry standard DIN rail. Field wiring is on the front of the module via a separate plug in connector. The module power and RS485 communications wiring is on a separate plug in connector on the bottom side of the housing.

Allow at least 25mm on front and below the module to accommodate the wiring. Ensure that enough space is available above and below the module for good ventilation.

### 2.2 Grounding/Shielding

In most cases, IO modules will be installed in an enclosure along with other devices which generate electromagnetic radiation. Examples of these devices are relays and contactors, transformers, motor controllers etc. This electromagnetic radiation can induce electrical noise into both power and signal lines, as well as direct radiation into the module causing negative effects on the system. Appropriate grounding, shielding and other protective steps should be taken at the installation stage to prevent these effects. These protective steps include control cabinet grounding, module grounding, cable shield grounding, protective elements for electromagnetic switching devices, correct wiring as well as consideration of cable types and their cross sections.

### 2.3 Network Termination

Transmission line effects often present a problem on data communication networks. These problems include reflections and signal attenuation.

To eliminate the presence of reflections from the end of the cable, the cable must be terminated at both ends with a resistor across the line equal to its characteristic impedance. Both ends must be terminated since the direction of propagation is bi-directional. In the case of an RS485 twisted pair cable this termination is typically 120 ohms.

## 2.4 Setting the Modbus Node ID

### 2.4.1 Node ID Table

The following table assists with the setting up of DIP switches for the required NODE ID.

#### 2.4.2 DIP Switch Status Register.

Each module uses register 30100 to store the status of the DIP switches.

## 2.5 Communications Settings

The data in the modules is stored in 16 bit registers. These registers are accessed over the network using the MODBUS RTU communication protocol.

### 2.5.1 Communications Settings with DIP Switch 10 OFF (Default)

BAUD RATE	9600
DATA BITS	8
PARITY	NONE
STOP BITS	1

### 2.5.2 Communications Settings with DIP Switch 10 ON (Programmed Baud Rate)

BAUD RATE	2400, 4800, 9600, 19200, 38400, 57600, 115200
DATA BITS	8
PARITY	None, Even, Odd
STOP BITS	1, 2

Note: These settings are done from IO Studio PC software or Modbus Master device.

For ex: If you are planning to use HMI (Brainchild) as Master device, then it is possible to set above parameters writing a small application program in HMI. During this mode, DIP switch10 should be OFF such that, Master device can communicate with IO module on default communication settings.

### 2.5.3 Communications Settings Registers

40121	Baud Rate	2400	11520	R/W	2400, 4800, 9600, 19200, 38400, 57600, 11520
40122	Parity	0	2	R/W	0 = none, 1 = even, 2 = odd
40123	Stop Bits	1	2	R/W	1 = 1 stop bit, 2 = 2 stop bits
40124	Reply Delay	0	65535	R/W	(x10ms)

#### 2.5.3.1 Baud Rate Register (40121)

The baud rate value is programmed directly into the baud rate register. The only exception is the 115200 baud rate where the value 11520 is used.

#### 2.5.3.2 Parity Register (40122)

The parity can be set to none by writing a 0 to the parity register, set to even by writing a 1 to the parity Register or set to odd by writing a 2 to the parity register.

#### 2.5.3.3 Stop Bits Register (40123)

The number of stop bits can be set to 1 by writing a 1 to the stop bits register or set to 2 by writing a 2 to the stop bits Register.

### 2.5.3.4 Reply Delay Register (40124)

The reply delay is a time delay between the Modbus message received to the reply being sent. In some applications where a modem or radio is used in the RS485 network, it may be necessary to add a reply delay due to turn around delays in the equipment.

### 2.5.4 Modbus Register Types

There are 4 types of variables which can be accessed from the module. Each module has one or more of these data variables.

Type	Start Address	Variable	Access
1	00001	Digital Outputs	Read & Write
2	10001	Digital Inputs	Read Only
3	30001	Input registers (Analog)	Read Only
4	40001	Output registers (Analog) (Holding type)	Read & Write

Note: The Modbus message length must be limited to 100 consecutive read or write registers. If more registers are required then a new poll group must be added for the next xxx registers.

## 3. IO MODULES

### 3.1 IO-16DI - DIGITAL INPUTS WITH COUNTERS

#### 3.1.1 Description

The IO-16DI module is a 16 channel digital input module. The inputs are isolated from the logic by bi-directional opto-couplers. The inputs are divided into 2 isolated groups of 8 inputs each. This allows for many configurations in which the input module may be used. One such configuration could be where one group is connected as common positive and the second group connected as common negative.z

The counters operate in three modes.

In **mode 0**: All the counters are disabled.

In **mode 1**: The counters are 32 bit counters allowing a count value from 0 to 4294967295. The count value can be cleared by writing a zero to the associated registers or preset to any other value using the same method.

In **mode 2**: The inputs are connected as up/down counters. Input 1 will increment counter 1 while input 2 decrements counter1. In the same way, inputs 3&4 operate counter 2, inputs 5&6 operate counter 3 and inputs 7&8 operate counter 4 etc..

**Note:** The count values are not battery backed-up and will be lost if power is turned off.

The format of the registers allows the status of the inputs to be read as either single bits or all at once as a single register on the Modbus network.

### 3.1.2 Technical Specification of IO-16DI

<b>Power Supply</b>	Logic Supply Voltage	12 -24 Vdc
	Logic Supply Current	30mA @ 12V / 17mA @ 24V
<b>Digital Inputs</b>	Input Points	16
	Input Voltage Range	12 - 24 Vdc
	Input Current per input	5mA @ 12Vdc / 11mA @ 24Vdc
	Isolation	1500VRms between field and logic
<b>Counters</b>	Inputs	1 to 16
	Resolution	32 Bits
	Frequency	1KHz (max)
	Pulse Width	500us (min)
<b>Temperature</b>	Operating Temperature.	-10°C to + 50°C
	Storage Temperature	-40°C to + 85°C
<b>Connectors</b>	Logic Power and Comms.	4 Pin Connector on bottom side of unit
	Inputs	18 Way screw connector on front

**Note:** Inputs 1 to 16 are used as both digital inputs and counter inputs.

### 3.1.3 Status Indicators

- Power:** Flashes to indicate the CPU is running.  
**RS485 Rx:** Flashes to indicate the unit has received a valid Modbus message.  
**RS485 Tx:** Flashes to indicate the unit has sent a Modbus message.  
**Input Status:** “OFF” when the input is off.  
                   “ON” when the input is on.

### 3.1.4 Wiring

The following diagram shows how the digital inputs are connected to potential free switches. The common can be connected to positive or negative as indicated.

The following diagram shows how the digital inputs are connected a NPN transistor or a PNP transistor.

The following diagram shows the wiring for the power and RS485 communications.

Note: If power/communication connections are reversed, module may become faulty.

### 3.1.5 Switch Settings

<u>SWITCH</u>	<u>FUNCTION</u>	<u>DESCRIPTION</u>
1	NODE ID +1	Node ID's from 0 to 127 are set up using switches 1 to 7
2	NODE ID +2	"
3	NODE ID +4	"
4	NODE ID +8	"
5	NODE ID +16	"
6	NODE ID +32	"
7	NODE ID +64	"
8	INVERT	When switched ON the status of the inputs is inverted in the Modbus status register (30002).
9	-	Not Used.
10	BAUD RATE	Selects 9600 (off) or Programmed Baud Rate (on)

### 3.1.6 IO-16DI Data Registers (MODULE TYPE = 100)

Modbus Address	Register Name	Low Limit	High Limit	Access	Description
10001	Digital Input 1	0	1	R	Status of Digital Inputs.

### 3.1.6.1 Digital Input Register.

The digital inputs can be read in a single register as follows:

IO-6DI DIGITAL INPUTS																ADDRESS
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
32768	16384	8192	4096	2048	1024	512	256	128	64	32	16	8	4	2	1	30002
16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	

Digital Input Number

### **3.1.6.2 Counter Registers.**

The counters are stored in two 16 bit registers. The first register is the High Register and the second register is the Low Register. To get the actual 32 bit count value the registers must be combined as follows:

Counter High Value = Register 40003.

Counter Low Value = Register 40004.

Counter Value = (Counter High Value X 65535) + Counter Low Value.

### **3.1.6.3 Counter Capture.**

To capture a counter a 1 must be written to the corresponding bit position in the Counter Capture Register 40035. For example:

1. Writing 1 to Register 40035 results in Counter 1 value being captured to Counter Capture 1.
2. Writing 2 to Register 40035 results in Counter 2 value being captured to Counter Capture 2.
3. Writing 3 to Register 40035 results in Counter 1 value being captured to Counter Capture 1 and Counter 2 value being captured to Counter Capture 2.

Once the module has captured the counters the Counter Capture Register 40035 is cleared to zero. It is possible to read this register to get confirmation that the capture is complete before reading the captured counter values.

### **3.1.6.4 Counter Auto Zero.**

The counter being captured can be auto zeroed. The purpose of this function is to let the module zero the counter so that no counts get lost due to delays from communication latency, etc.

To ensure that a counter is auto zeroed, a 1 must be written to the corresponding bit position in the Capture Zero Register 40103. For example:

Writing 1 to Register 40103 results in Counter 1 value being zeroed when the Counter Capture bit is 1, the value in the Capture Zero Register 40103 is permanently stored in memory and only has to be configured once.

## 3.2 IO-16DO - DIGITAL OUTPUTS

### 3.2.1 Description

This module has 16 open collector (NPN) digital outputs. The outputs may be used to drive lamps or external relays when more drive capability is required. The outputs are isolated from the logic and they share a common negative terminal. When switch 9 is off, the module is configured as a slave module for the Modbus master device such as a PC / PLC / HMI.

When used as a slave module, the outputs are written to by the Modbus master device such as a PC/PLC/HMI. Each output can be individually switched on or off, or all outputs can be set up at the same time by writing a single number to the output register which represents the status of all outputs.

An output watchdog timer can be configured to switch off all the outputs if there has been no communications with the module for up to 255 seconds. A value of 0 seconds will disable this timer and the outputs will remain in the last programmed state.

#### 3.2.6.2 Output Watchdog Timer

The watchdog timer is used to switch off all of the outputs in the event of a communications failure. When set to zero (register 40101) the watchdog timer is disabled.

### 3.3 IO-4RO - RELAY OUTPUTS

#### 3.3.1 Description

The IO-4RO module has 4 normally open/ normally closed relay outputs. These modules may be used when a higher drive capability is required, or when isolation between outputs are required.

When switch 9 is off, the module is configured as a slave module for the Modbus master device such as a PC / PLC / HMI. When used as a slave module, the outputs are written to by the Modbus master device such as a PC/PLC/HMI. Each output can be individually switched on or off, or all outputs can be set up at the same time by writing a single number to the output register which represents the status of all outputs.

## 3.4 IO-8DIO - DIGITAL INPUTS / OUTPUTS

---

### 3.4.1 Description

The IO-8DIO module is an 8 channel digital input and 8 channel digital output module.

The inputs are isolated from the logic by bi-directional opto-couplers. The common is connected internally to either the -volts or +volts field power supply terminals using a jumper link which is situated inside the housing.

The inputs have internal counters associated with them. These counters are 32 bit counters allowing a count value from 0 to 4294967295. The count value can be cleared by writing a zero to the associated registers or preset to any other value using the same method. The counters can also be reset automatically when read. This is done by setting on DIP switch 9 on the front panel.

**Note:** The count values are not battery backed-up and will be lost if power is turned off.

The format of the registers allows the status of the inputs to be read as either single bits or all at once as a single register on the Modbus network.

The 8 digital outputs are open collector (NPN). The outputs may be used to drive lamps or external relays when more drive capability is required. The outputs are isolated from the logic and they share a common negative terminal.

The module may be configured as slave, where PC/ PLC/ HMI acting as master on the Modbus network. Dip switch 9 should be switched off to make this module as slave. Each output on the module can be individually switched on or off, or all outputs can be set up at the same time by writing a single number to the output register which represents the status of all outputs.

### 3.4.7.2 Digital Output Register

The digital outputs can be read /written in a single register as follows:

IO-8DIO DIGITAL OUTPUTS																ADDRESS
MSB	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
32768	16384	8192	4096	2048	1024	512	256	128	64	32	16	8	4	2	1	40003
0	0	0	0	0	0	0	0	8	7	6	5	4	3	2	1	

Digital Output Number

### 3.4.7.3 Counter Registers.

The counters are stored a two 16 bit registers. The first register is the High Register and the second register is the Low Register. To get the actual 32 bit count value the registers must be combined as follows:

Counter High Value = Register 40003.

Counter Low Value = Register 40004.

Counter Value = (Counter High Value X 65535) + Counter Low Value.

### 3.4.7.4 Output Watchdog Timer

The watchdog timer is used to switch off all of the outputs in the event of a communications failure. When set to zero (register 40101) the watchdog timer is disabled.

## 3.5 IO-8AI and IO-8AIV - ANALOG INPUTS

### 3.5.1 Description

The Analog Input modules are supplied as either a current input module (IO8AI) or a voltage input module (IO-AIV). The inputs are isolated from the logic and share a common negative terminal.

The standard setting for the IO-8AI module is 0 - 20mA input current which represents an output value of 0 - 4095 (12 bits) in the corresponding Modbus register. To obtain an output value of 0 to 4095 for an input signal of 4 to 20mA the offset switch is switched on.

The same applies to the IO-8AIV module. An input voltage of 0 - 10Volts represents an output of 0 - 4095 and 2 volts would give a reading of  $819 \pm 1\text{LSB}$ . To obtain an output value of 0 to 4095 for an input signal of 2 to 10V the offset switch is switched on. An input range of 0(1) to 5Vdc is available by removing the jumper link located on the analogue board inside the enclosure.

Analog Input: 12 Bit Value (0 - 4095)

#### 3.5.6.2 Analog Input Status

There are two status bits associated with each analog input. These bits are used to indicate if the input is zero or open circuit, in the working range 0-4095, or over range. If the input is open circuit or over range, then the error bit will be set. When the error bit is set, the range bit is zero if the input is open circuit and set if the input is over range, ie.,

<u>Bit 1- Error</u>	<u>Bit 2-Range</u>	<u>Condition</u>	<u>Status LED</u>
0	don't care	Input working OK	(LED OFF)
1	0	Input Open circuit or zero	(LED ON)
1	1	Input Over range	(LED FLASH)

The analog input status can be read in a single register as follows:

IO-8AI ANALOG INPUT STATUS																ADDRESS	
MSB	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	ADDRESS

## 3.6 IO-8AIIS and IO-8AIVS - ISOLATED ANALOG INPUTS

### 3.6.1 Description

The Analog Input modules are supplied as either a current input module (IO-8AIIS) or a voltage input module (IO-8AIVS). The inputs are fully isolated from input to logic and between inputs. This module is ideal for monitoring existing 4-20mA current loops which are isolated from each other and cannot be connected to a common point of reference.

The standard setting for the IO-8AIIS module is 0 - 20mA input current which represents an output value of 0 - 4095 (12 bits) in the corresponding Modbus register. To obtain an output value of 0 to 4095 for an input signal of 4 to 20mA the offset switch is switched on. This module can also be configured for a 0 – 20.000mA input range or +/- 20.000mA input.

The same applies to the IO-8AIV module. An input voltage of 0 - 10Volts represents an output of 0 - 4095 and 2 volts would give a reading of  $819 \pm 1$ LSB. To obtain an output value of 0 to 4095 for an input signal of 2 to 10V the offset switch is switched on. This module can also be configured for a 0 – 10.000V input range or +/- 10.000V input.

## 3.7 IO-8TC - THERMOCOUPLE INPUTS

---

### 3.7.1 Description

The IO-8TC module is a 8 thermocouple input module. The module uses differential inputs to reduce effects of electrical noise and mains pickup. The thermocouple inputs are isolated from the logic. If inter channel isolation is required then the IO-8TCS should be used.

The thermocouple voltage is read by the module circuitry, linearised and converted to degrees Centigrade. No ranging is required as the module covers the full range as indicated in the table of TC types. The value that is read from the Modbus register is the actual temperature in degrees centigrade to 0.1°C resolution. ie: a value of 3451 corresponds to a temperature of 345.1°C.

The thermocouple type is setup by writing a value to the TC Type register. The value is obtained from the table below. For example to select type K thermocouples, the value "2" must be written to the TC Type register. All 8 thermocouple inputs adopt the same TC type.

The DIP switch 9 is used to select upscale or downscale burnout. A value of 32768 is used to indicate upscale burnout and a value of -32767 is used to indicate downscale burnout.

The module has built in Cold Junction Compensation. Use must be made of the correct thermocouple extension wire to avoid reading errors.

The thermocouple module can also be configured for a 0 - 50mV input range. The TC Type register must be set to 9 for this option. The value in the register which is read back over the network is 0 - 50,000.

Note: As there is no inter-channel isolation, isolated thermocouples must be used in order to prevent ground loops and reading errors.

## 3.8 IO-8TCS - ISOLATED THERMOCOUPLE INPUTS

---

### 3.8.1 Description

The IO-8TCS module is a 8 isolated thermocouple input module. The module uses differential inputs to reduce effects of electrical noise and mains pickup. The thermocouple inputs are isolated from the logic and from each other. This module is operated in an identical way to the IO-8TC module and is fully interchangeable.

The thermocouple voltage is read by the module circuitry, linearised and converted to degrees Centigrade. No ranging is required as the module covers the full range as indicated in the TC table. The value that is read from the Modbus register is the actual temperature in degrees centigrade to 0.1°C resolution. ie: a value of 3451 corresponds to a temperature of 345.1°C.

The thermocouple type is setup by writing a value to the TC Type register. The value is obtained from the table below. For example to select type K thermocouples, the value "2" must be written to the TC Type register. All 8 thermocouple inputs adopt the same TC type.

The DIP switch 9 is used to select upscale or downscale burnout. A value of 32768 is used to indicate upscale burnout and a value of -32767 is used to indicate downscale burnout.

The module has built in Cold Junction Compensation. Use must be made of the correct thermocouple extension wire to avoid reading errors.

The thermocouple module can also be configured for a 0 - 50mV input range. The TC Type register must be set to 9 for this option. The value in the register which is read back over the network is 0 - 50,000.

## 3.9 IO-6RTD - RTD INPUTS

### 3.9.1 Description

The IO-6RTD module is a 6 RTD input module. The module can accommodate either 2 or 3 wire RTD sensors. The RTD inputs are isolated from the logic.

The RTD resistance is read by the module circuitry, linearised and converted to degrees Centigrade. No ranging is required as the module covers the full range of the RTD as indicated in the RTD table. The value that is read from the Modbus register is the actual temperature in degrees centigrade to 0.1°C resolution. ie: a value of 3451 corresponds to a temperature of 345.1°C.

The RTD type is setup by writing a value to the RTD Type register. The value is obtained from the table below. For example to select a PT100 RTD, the value "1" must be written to the RTD Type register. All 6 RTD inputs adopt the same RTD type.

The DIP switch 9 is used to select upscale or downscale burnout for break detection. A value of 32768 is used to indicate upscale burnout and a value of -32767 is used to indicate downscale burnout.

Note: As there is no inter-channel isolation, isolated RTD's must be used in order to prevent ground loops and reading errors.

## **3.10 IO-DAIO – DIGITAL + ANALOG INPUTS AND OUTPUTS**

---

### **3.10.1 Description**

The IO-DAIO module is a multipurpose combination of inputs and outputs. The module can accommodate either 2 or 3 wire RTD sensors, current (0-20mA) and voltage (0-10V) inputs, current (0-20mA) or voltage (0-10V) output, and digital inputs and outputs.

#### **RTD INPUTS:**

There are 2 RTD inputs on the module. The RTD resistance is read by the module circuitry, linearised and converted to degrees Centigrade. No ranging is required as the module covers the full range of the RTD as indicated in the RTD table. The value that is read from the Modbus register is the actual temperature in degrees centigrade to 0.1°C resolution. ie: a value of 3451 corresponds to a temperature of 345.1°C.

The RTD type is setup by writing a value to the RTD Type register. The value is obtained from the table below. For example to select a PT100 RTD, the value "1" must be written to the RTD Type register.

A value of -32767 is used to indicate downscale burnout.

Note: As there is no inter-channel isolation, isolated RTD's must be used in order to prevent ground loops and reading errors.

#### **ANALOG INPUTS:**

The Analog Inputs (2) can be configured by internal jumpers as either a current input (0-20mA) or a voltage input (0-10V).

An input of 0 - 20mA input current or 0 – 10V input voltage represents an output value of 0 - 4095 (12 bits) in the corresponding Modbus register.

#### **ANALOG OUTPUT:**

There is a single analog output which can be configured with internal jumpers for a current output (0-20mA) or voltage output (0-10V).

The resolution is 12 bits, so writing a value to the Modbus register for each output of 0 - 4095 would give an output current of 0 - 20mA. A value of  $819 \pm 1\text{LSB}$  will give a current output of 4mA.

#### **DIGITAL INPUTS:**

There are 4 digital inputs on the module. The inputs share a common terminal and can be configured for common positive or common negative.

The inputs have got counters associated with them. The counters operate in three modes.

In **mode 0** all the counters are disabled.

In **mode 1** all counters are 32 bit counters allowing a count value from 0 to 4294967295. The count value can be cleared by writing a zero to the associated registers or preset to any other value using the same method.

In **mode 2** the inputs are connected as up/down counters. Input 1 will increment counter 1 while input 2 decrements counter1.

**Note:** The count values are not battery backed-up and will be lost if power is turned off.

The format of the registers allows the status of the inputs to be read as either single bits or all at once as a single register on the Modbus network.

#### **DIGITAL OUTPUTS:**

The module has 2 open collector (NPN) digital outputs. The outputs may be used to drive lamps or external relays when more drive capability is required.

The outputs are written to by the Modbus master device such as a PC/ PLC/ HMI. Each output can be individually switched on or off, or all outputs can be set up at the same time by writing a single number to the output register which represents the status of all outputs.

An output watchdog timer can be configured to switch off all the outputs if there has been no communications with the module for up to 255 seconds. A value of 0 seconds will disable this timer and the outputs will remain in the last programmed state.

## 3.11 IO-8AOI - ANALOG OUTPUTS

---

### 3.11.1 Description

The IO-8AOI is a 8 channel current output module. Each channel can be set to output a current in the range 0 - 20mA. The outputs are isolated from the logic and share a common negative terminal.

The resolution is 12 bits, so writing a value to the Modbus register for each output of 0 - 4095 would give an output current of 0 - 20mA. A value of  $819 \pm 1\text{LSB}$  will give a current output of 4mA.

The module configured as slave, where PC/ PLC/ HMI act as Master in the Modbus network. DIP switch 9 should be switched off to make this module as slave. The outputs are written to by the Modbus master device such as a PC/ PLC/ HMI.

## **4. IO STUDIO**

---

This is PC software used for setting communication parameters of the IO module, Read IO status directly in PC, Force Outputs to test the module and used as tool for module diagnostic purpose.

Install IO Studio software in PC.

**IO Module:** Set address say 1 for the IO Module using DIP switches on the Module itself. Connect 24V DC Power supply and make sure that Dip switch10 is Off to allow communication of IO Module with other devices on Default communication settings. If you are using RS232/RS485 converter like SNA10A from Brainchild make sure that you have selected all the communication settings properly as follows.

BAUD RATE	9600
DATA BITS	8
PARITY	NONE
STOP BITS	1

In the PC, select above settings at the COM port.  
Right click on Mycomputer –Properties - Hardware-Device Manager- COM ports

Start the IO Studio software as shown above.

If every thing is proper, IO Studio will read the IO Module and show the status of the IO registers. If it shows RED indication as above, then please check the dip switch status on the IO Module, RS232/RS485 converter settings and COM settings in the PC and also check the cable that is used between PC and RS232/RS485 converter. Many times, you might have more than one COM port on your PC, You should make sure that which COM port is using for this purpose and select the correct COM port in the above shown setup.

### **Configuration:**

For ex: If you want set baud rate, enter the required value in the register 40121, then press enter in the PC keyboard. Set all the parameters once and then switch off the power supply to the IO Module. Now switch on the Dip switch 10 on the module to make above settings effective. After power on, the IO Module will have new Communication settings. Please note that at this point of time, IO module may not communicate with PC because you may have different settings at RS232/RS485 converter and also COM port settings in the PC.

### **Testing the IO Module:**

For ex: If you want to test IO-16DO module. It contains total 16 digital outputs. You can connect IO module with PC as explained above via RS232/RS485 converter. You can force digital output from low to high and check its status at the IO module and also u can observe LED status on the IO Module itself.

## **5. SPECIFICATIONS**

### **5.1 ENVIRONMENTAL**

Operating Temperature	-10°C to +50°C
Storage Temperature	-40°C to +85°C
Humidity	Up to 95% non condensing

### **5.2 EMC INSTALLATION INSTRUCTIONS**

1. Screened twisted pair RS485 cable must be used with the screen grounded at one point only.
2. The RS485 cable must be terminated at both ends using a 120ohm resistor.
3. Use should be made of screened I/O, T/C, RTD cable with the screens grounded at one point as close to the IO module as possible.
